

ANNOUNCED AT DREAMFORCE 2026

Seven agents. Seven jobs.

Agentforce agents that arrive already built for one specific job — so you configure instead of create.

Casey

HELP AGENT

Answers and resolves customer service issues — on voice, SMS, WhatsApp and chat.

GA NOW

Fin

CUSTOMER AGENT

Handles the harder customer workflows that a simple help agent hands off.

GA NOW

Piper

INBOUND PIPELINE

Works your website and inbox, qualifies inbound leads, turns them into pipeline.

GA NOW

Hunter

OUTBOUND SALES

Researches accounts and runs outreach — and stays on a deal for weeks alongside the seller.

PILOT · GA NOV '26

Carter

SHOPPER AGENT

Helps shoppers find and compare products, then checks them out in the chat.

GA NOW

Paige

IT & HR SERVICE

Resolves employee IT and HR requests in Slack and the portals they already use.

GA NOW

Marshall

SUPPLY CHAIN & OPS

Runs multi-step back-office processes across systems, and logs every action.

GA NOW

All seven are Agentforce.

Not a separate product, not a locked box. Same platform, same data, same security — just already set up for a job. Rename them, extend them, switch them off.

WHEN TO REACH FOR ONE

What you hear → who handles it

If a customer says something in the left column, there is already an agent for it.

If you hear this...	Look at	Because
<i>"Our support queue keeps growing and we keep hiring to keep up."</i>	Casey	Deflects the repeatable tickets across every channel.
<i>"Leads come in through the website and nobody works them fast enough."</i>	Piper	Engages and qualifies inbound the moment it lands.
<i>"Our reps spend more time researching accounts than selling."</i>	Hunter	Does the research and the outreach, seller stays in control.
<i>"IT and HR get the same twenty questions every single week."</i>	Paige	Resolves them in Slack before they become a ticket.
<i>"Shoppers abandon because they cannot find the right product."</i>	Carter	Guides the choice and closes the sale in the conversation.
<i>"Our back-office process touches six systems and four teams."</i>	Marshall	Orchestrates the whole thing and logs every step.
<i>"The simple stuff is automated but the complex cases still escalate."</i>	Fin	Built for the workflows that normally need a human.

One thing to check before you promise anything

Every one of these grounds itself in the customer's own data and runs inside their permissions. If the knowledge base is a mess, the agent will be too. Scope the first use case to somewhere the data is already clean — that is what separates the six-week wins from the pilots that stall.

THE QUESTION EVERY CUSTOMER ASKS

“Why not just build it ourselves?”

You can. That is the honest answer — it is the same platform either way. The real question is much smaller than it sounds.

Take the pre-built agent

WHEN ALL OF THIS IS TRUE

- The job is one most companies do the same way.
- You want it live this quarter.
- You do not have a team free to build and maintain it.
- It needs to work across several channels.
- Nobody picks you because of how you do this job.

Build your own

WHEN ANY OF THIS IS TRUE

- The process is yours and it is a real advantage.
- It depends on systems or data unique to you.
- No agent in the list fits the role you need.
- You have the team, and the appetite to keep tuning it.
- A rule or contract dictates how it must work.

Most customers end up doing both.

Pre-built covers the common work, custom handles the exceptions, and Multi-Agent Orchestration passes work between them. Starting packaged does not close the door on building.

The 10-second version

Is this job special to them?

If no — take the pre-built agent. If yes — build.

Is there a team to build it?

If not, the decision is already made for them.

How clean is their data?

Bad data breaks both options equally. Fix it either way.
